1.0 INTRODUCTION

MTE Consultants Inc. (MTE) was retained by Parkwood Developments (Kitchener) Ltd. to complete a Functional Servicing Report, in support of the proposed subdivision development for the lands west of Vivian Street located in the Municipality of West Perth. The subject site consists of two main pieces of land:

- The land west of Vivian Street consisting of approximately **1.74ha** generally bounded by a line of the Canadian National Railway (CNR) to the north, Vivian Street to the west, Frank Street to the south and Residential Lands to the east.
- The said land is split in two pieces by the part of land that is currently undeveloped but will be the extension of Clayton Street.

Vivian Street is also to be constructed as a part of this development, as shown in Figure 1.0. The development will also include the extension of Clayton Street, which will connect the existing end of Clayton Street with the proposed Vivian Street and will extend to the property limits to provide access for future development. Additionally, a dry pond is proposed to be installed along Vivian Street just south of the Clayton Street extension to control the storm flows. The northern 20m of the subject lands will not be developed as they are in a setback zone from a high-pressure gas line running along the northern property line adjacent to the Goderich Exeter Railway (GEXR) lands.

It is proposed to develop the lands into 30 semi-detached houses units with 14 units to the north of the Clayton Street extension, the dry pond south of the Clayton Street extension and the remaining 16 residential units to the south of the dry pond. All new housing units will be fronting Vivian Street.

Lands situated east of Vivian Street and north of Clayton Street, are zoned R3-1 and currently remain undeveloped. The proposed sanitary sewer, and watermain systems will be designed to accommodate future service connections from these lands. The proposed storm pipes and the stormwater management (SWM) facility will be sized to manage post development peak flow conditions from that external lands as well as the rear yards of the existing development located along Kenton Street to the ease to the east.

A Draft Plan for the proposed development has been prepared by GSP Group. This proposed Draft Plan forms the basis for the preliminary servicing design and can be found in Appendix A.

2.0 MUNICIPAL SERVICING

2.1 Sanitary Servicing

The sanitary sewage from the proposed development will discharge to the existing 200mm sanitary sewer within the right-of-way of Clayton Street. The connection will be achieved with the installation of a sanitary manhole (SAMH6) at the end of an existing stub (located at a depth of approximately 5.0m), located at the existing end of Clayton Street. Proposed 200mm diameter sanitary sewers will convey the sewage of all proposed and future houses along Vivian Street to Clayton Street and to the aforementioned SAMH6.

The preliminary sanitary servicing plan for the proposed development can be seen on Figure 2.0. The sanitary sewers are proposed to be constructed at depths that will allow for the majority of the development to be serviced via gravity sewers, some lots may need grinder pumps for basement discharge closer to Frank Street.

The sanitary sewers will be constructed within Vivian Street and Clayton Street at depths ranging from 1.6m (minimum) to 5.0m (maximum). The minimum cover will be at the south end of Vivian Street where the road will steeply slope down. For the majority of the road the pipe will be at depths greater than 2.5m.

The sanitary sewer design spreadsheet and the respective plan can be found in Appendix B.

As shown in the appended drawing, the capacity of the sanitary network can accommodate the proposed development up to the downstream 450mm pipe along Clayton Street located just east of Napier Street. Capacity of the sewers downstream of this point and the capacity of the wastewater treatment plant to accommodate the proposed development will have to be confirmed with the Municipality of West Perth.

2.2 Water Distribution

Water supply for the proposed development will be provided by connection to the existing 150mm watermain within Clayton Street, roughly 20m from the proposed Vivian Street centreline.

At the crossing of Vivian Street and Clayton Street, this pipe will split into two runs along Vivian Street: one to the north of the crossing and one to the south. The pipes will provide water to all the proposed lots.

The existing and proposed water distribution networks are illustrated on Figure 3.0 and include preliminary pipe sizes.

Based on the preliminary analysis the following conclusions can be made:

- Connection to the existing watermain along Clayton Street will adequately service the proposed development; and
- Two fire hydrants are proposed to be installed within the Vivian Lane right-of-way, which will ensure compliance with the Municipality of West Perth Development and Servicing Guidelines that requires a maximum hydrant spacing of 150m.

Confirmation will be required with the Municipality of West Perth that there will be adequate pressure and flow throughout the entire proposed development.

2.3 Storm Sewer Servicing

A detention pond (dry pond) is proposed to be installed south of Clayton Street within the development. The pond will accommodate minor and major flows from the development and the roads that are to be constructed as a part of it. While lands north of Clayton and east of Vivian are not a part of the subdivision, these lands, as well as lands adjacent to it at its east side, have been considered for the purpose of designing the storm sewer system within Vivian Street.

Flows will be controlled in the pond by an orifice. Controlled flows will then be conveyed to the Smith Drain that runs in the adjacent agricultural land to the west of the site.

A network of storm sewers is proposed to be installed along Vivian Street, along the west portion of the existing part of Clayton Street and along the rear property lines of some of the lots. The storm sewer network will convey the site's runoff to the dry pond. The pipes along the roads will be overdesigned to convey the 100-year storm flows to the pond. The pipes at the rear yards will be designed for the 5-year storm with runoff from major events will be temporarily stored in the swales where these pipes are to be installed in.

A minor portion of the site including strips of land along the rear lot lines and a portion of the Clayton Street extension that will be sloped towards the neighbouring lands to the west will not be drained by the proposed storm network.

The I.D.F parameters for the design of the storm sewers (either for the 5-year or the 100-year storm event, has been derived from the City of Stratford's Design Guidelines. The sewer network will be designed to operate by gravity and is proposed to be constructed at depths of 0.8m (minimum) to 3.7m (maximum) below finished grades. With the exception of a small portion of the network at the edges of Vivian Street, and the pipes discharging Block 24 and the rear yards of the northern part of the development, the majority of the pipes will be installed at depths greater than 1.5m. The preliminary storm servicing plan for the proposed development can be seen on Figure 4.0, and the storm sewer design spreadsheet and the respective plan can be found in Appendix B.

PRELIMINARY STORM SERVICING PLAN

Drawn: AXF	Scale: 1:1,500	Figure: **4.0**
Checked: SAH	Project No.: 62167_001	
Date: 2025-11-12	Rev No.: 2	

Plot Date: November 12, 2025 – 10:40 AM

3.0 STORMWATER MANAGEMENT

The post-development peak flow rates were determined through the use of MIDUSS NET, a hydrologic and hydraulic modeling program. This program allows the user to analyze the impact of developments on new and existing systems through the use of accepted rainfall data. The program allows the user to represent design storms of various durations, and aids in the design of stormwater management facilities.

The City of Stratford's IDF curve parameters were used for the rainfall data utilizing a 4-hour Chicago Storm distribution model with a peak ratio of 0.40. These parameters were used to determine the peak flow rates for the 100-year storm event.

3.1 Allowable/Pre-Development Conditions

The subject land is currently used for agricultural purposes. The site is generally sloped from east to west towards the neighbouring agricultural lands and the Smith Drain. Along the north-south axis the lowest elevations are generally located within or close to the Clayton Street right-of-way. The site's runoff is eventually directed towards a branch of the Smith Drain. The lands at the south of the development are relatively flat with no clearly defined drainage patterns.

As per the 1982 Plan and Profile drawing of Smith Drain's Branches 'B' and 'C' (see Appendix C), runoff from the whole aforementioned area, external lands to the northeast and the rear yards of the adjacent existing development located to the east along Kenton Street discharge to these branches of Smith Drain, which is located roughly 10m west of the western property line. These lands cover an area of approximately 4.497ha.

According to the City's Drainage Superintendent the allowable discharge of the 6.8ha total area of the site and the lands that adjoin it from the east, is 16.4 l/s. The numbers mentioned above yield an allowable flowrate of roughly **11 l/s** for the site.

3.2 Post-Development Conditions

As per the Municipality of West Perth's requirements, the stormwater runoff from the development will have to be controlled to the allowable capacity of Smith Drain, for all the design storms with periods of return between 5 and 100-yr, using the City of Stratford's IDF parameters.

The site's storm pipes will be overdesigned as needed to convey the 100-year storm flows to the pond. See the Storm Drainage Area Plan in Appendix B for more information.

It is noted that the external lands to the northeast and the rear yards of the adjacent existing development located to the east along Kenton Street will convey flows to the development. These lands have been included in the modeling for the calculation of the post development hydrograph.

Hence, all the lands that will be draining to the proposed dry pond have been considered to be one catchment, **Catchment 201**. It has to be noted that Catchment 201 is slightly smaller (4.417 versus 4.497ha) than area that will drain to the Smith Drain. The reason for this is some landscaped strips of land at the rear yards that are impossible to drain to the pond and a portion of the Clayton Street extension that will be developed in the future.

In order to achieve the stormwater management quantity control objective, the runoff generated by the proposed development will be controlled by a 60mm diameter online orifice installed in a storm ditch inlet catchbasin (DDICB14) located inside the proposed dry pond at an invert elevation of 345.030m. The storage provided in the detention pond along with the orifice will control all minor and major (up to an including the 100-year storm) flows from the site.

The post-development peak flows will be restricted to the maximum allowable flowrate for the Smith Drain. As shown in Appendix D the 100-yr flowrate from the pond will be matching the allowable, at **11 l/s**. Therefore, flowrates from the pond for all the other events with lower period of return will also not exceed this number.

Refer to Appendix D for modeling information and results.

3.3 Water Quality Control

It is anticipated that the site will also require stormwater quality controls to obtain a minimum of Enhanced Level of quality control as defined by the Ministry of the Environment, Conservation and Parks (MECP). An Enhanced Level of quality control is defined by the MECP as removing 80% of the total suspended solids from the stormwater discharge. This could be achieved by the installation of an oil-grit separator (OGS) unit just downstream of the structure where the site's control orifice will be installed.

4.0 ROADWORKS AND LOT GRADING / SITE GRADING AND PAVEMENT DESIGN

Access to the proposed development will be the extension of Clayton Street or Frank Street or by the future extension of Vivian Street to the north, located north of the railway line.

For Vivian Street preliminary centerline road grades for the proposed roadways will most likely range from 0.50% (minimum) to 3.5% (maximum). These grades will generally slope towards the dry pond location that is roughly at the middle of the portion of the road that is to be developed. For Clayton Street preliminary centerline road grades for the proposed roadways will most likely range from 0.50% (minimum) to approximately 5.0% (maximum). These grades will generally slope from east to west. Refer to Figure 5.0 for details.

The proposed roadways will be constructed to a full urban cross-section including asphalt pavement, concrete curb and gutters, concrete sidewalks, roadway illumination and boulevard landscaping all in accordance with the standards of the Municipality of West Perth, wherever feasible. A proposed pavement structure is summarized in Table 4.1 below.

Table 4.1 – Preliminary Pavement Structure

Pavement Structure Component	**Component Design Depth** (mm)
Surface Asphalt	40*
Base Asphalt	50*
Granular 'A' Base	150*
Granular 'B' Sub-base	450*

*A geotechnical investigation is required to provide the pavement structure based on site characteristics

Preliminary lot grades will range from 2.0% (minimum) to approximately 6.5% split drainage type lots. Together with the centerline road grades, the development's lot grading will be designed to generally meet the following criteria:

- Match existing road grades at the subdivision access;
- Match existing grades around the perimeter of the development;
- Ensure adequate cover is provided over municipal services;
- Ensure 'major' overland flow routes are directed to the proposed SWM facilities and the downstream outlets as shown in Figure 6.0; and
- Comply with the current municipal standards for minimum and maximum road grades and for various other lot grading specifications including minimum and maximum grades and rear-yard swale widths, depths, and slopes.

5.0 UTILITY SERVICING

Utility servicing of the proposed development will be completed through the connection to and the extension of existing services along Clayton Street. An application will be made to ERTH Power during the detailed design stage for hydro servicing. Enbridge Gas (natural gas), Bell Communications (telephone and internet services), and Quadro Communications (telephone and internet services) servicing will be coordinated during the detailed design phase.

6.0 SUMMARY

Based on the foregoing analysis, the main findings of the functional servicing report for the proposed development are:

- The proposed development can be adequately serviced through the extension of gravity sewers and municipal watermains.
- The sanitary sewage generated from the development will be discharged into the existing Clayton Street sewer. Downstream sewers up to the 450mm pipe along Clayton Street east of Napier Street have been constructed with adequate capacity for the proposed development.
- Water supply for the proposed development will be provided by the existing 150mm watermain along Clayton Street.
- The stormwater management quantity control requirements for the proposed development can be accommodated by storing stormwater in a proposed detention facility and controlling the flowrates with a combination of an orifice and a weir.
- The stormwater quality control requirements for the proposed development can be achieved by the installation of an OGS unit downstream of the quantity control location.
- Overall site grading will provide for 'major' overland flow conveyances throughout the site, will provide adequate cover over the site's services, and will generally match existing road and boundary grades with appropriate slopes.

CONSTRUCTION NOTES – (SPECIAL PROVISIONS)

General Notes

Note – The contractor shall supply all labour, equipment and materials to complete the work outlined except as per General Note # 4

1. Working Area – General Condition E.38
   - For tile installation by tiling machine or backhoe – 10 metres on either side of new trench or any combination not to exceed 20 metres – where trenching is required to permit tile installation by tiling machine increase above dimensions to 15 metres and 30 metres respectively.
   - For sewer pipe installation by backhoe Station 179.6 to 400
     - 15 metres on either side of new trench or any combination not to exceed 30 metres.
   - For installation by boring Station 1+630.8 north
     - 15 metres on either side of bore pit or any combination not to exceed 30 metres by 15 metre length from fenceline.

2. Access – General Condition E.39
   - The contractor shall have access to the drain along the routes shown on the plan and then along the drain path or from existing road allowances and then along the drain path.
   - Each access route shall be along existing laneways, roads or road allowances or over a 6 metre (maximum) wide path where no roadway or laneway exists.
   - All specifications governing fences, livestock and crops during drain construction shall apply to access routes.
   - No other access routes shall be used unless first approved by the Engineer and the affected landowner.

3. Laying Tile or Sewer Pipe – Standard Specification F.2.3.E
   - Wherever backhoe is used or trenching is required, topsoil to be stripped, saved and replaced separately.
   - For joint protection due to tile or sewer pipe irregularities or alignment irregularity such as at bends the contractor shall use a 400 mm – 600 mm width of filter fabric (Texel #7609 is suggested) to fully protect the joint. At all pipe-tile junctions and at tile size changes the junction shall be fully and tightly wrapped with a 400 mm – 600 mm width of fabric.
   - A 150 mm overlap on top is required.
   - No additional payment will be allowed for implementing these protective measures.

4. Soil Instability – Standard Specification F.2.3.I
   If soil instability is encountered during construction, tile or sewer pipe may have to be installed on a 300 mm ± (minimum depth) bedding of crushed stone. No additional payment will be allowed for such work except that the stone as required and directed by the Engineer will be supplied by the Township at no cost to the contractor (the cost of the stone will be added to the final project cost).

5. Catchbasins – Standard Specification F.2.3.O
   - At all on-line catchbasins place crushed stone from bottom of excavation to inverts of all tile or pipe. Stone is to extend from catchbasin to start of standard tile trench. Approximately 2 cubic metres required per catchbasin. For offset catchbasins use stone as required at connections. For offset ditch inlet catchbasins backfill low wall area using the 2 cubic metres of stone specified above.
   - All catchbasin sumps to be fully cleaned by the contractor after completion of the drain installation and backfilling.
   - Grates for ditch inlet tops to have vertical bars with 100 mm minimum spacing.

6. Texel Filter Fabric
   Material is available from Terrafix, Rexdale, Ontario. (416 - 745 - 7290)
   Approved equal will also be considered by the Engineer.
   Contractor is to avail himself of manufacturer's recommendations for installation, cutting and precautions necessary to avoid damage to fabric.

7. Miscellaneous Elevations
   Elevations were only determined along the staked route except for those shown, if any, on the plan. If any owner wishes to determine if other low areas can be drained, he is to contact the engineer.

8. Riprap
   All riprap is to be placed on filter fabric underlay (Texel #7612 is suggested) unless directed otherwise on plan.
   Along upstream edges of riprap, where surface water will enter, underlay is to extend a minimum of 300 mm upstream from riprap and then be keyed down a minimum of 300 mm. The riprap is to be heavy stone (quarry stone is suggested) with particles averaging in size from 225 mm to 450 mm and is to be placed at 450 mm thickness.
   Wherever riprap is used, the area is to be overdug so that finished top of riprap is at design cross-section at design elevation or flush with existing ground.

SPECIFIC NOTES

A) TILE PORTION

i) BRANCH B

-003 TO 003
- NEW TILE OUTLET TO BE ON NORTH SIDE OF EXISTING OUTLET.
- PLACE RIPRAP PROTECTION WITH FILTER FABRIC UNDERLAY TO PROTECT DITCH BANK (APPROX. 5 m^2 AREA).

000 TO 008.5
- BERM ON DITCH BANK TO BE FULLY RESTORED TO EXISTING CONDITION.
- CONTRACTOR SHALL BE RESPONSIBLE FOR WASHOUT OF BERM IN THIS AREA DURING ONE YEAR MAINTENANCE PERIOD.
- CONTRACTOR TO SEED OR RIPRAP BERM ON DISTURBED AREA AS REQUIRED TO ENSURE STABILITY.
- ENSURE THAT OVERFLOW CULVERT IS UNIMPEDED AFTER RESTORATION COMPLETED.

000 TO 567
- NEW TILE TO BE INSTALLED JUST INSIDE NORTH AND EAST EDGE OF GRASS WATERWAY THROUGHOUT.
- LAND OWNER RESPONSIBLE FOR RESEEDING DISTURBED EDGE OF GRASS WATERWAY.

000 TO 918 = 000 AH'D
- IF EXISTING PRIVATE TILE IS INTERCEPTED IT SHALL BE CROSS-CONNECTED OVER OR UNDER THE NEW DRAIN IN AN APPROVED MANNER.
- IF CROSS-CONNECTION IS NOT POSSIBLE THEN BOTH ENDS OF EXISTING DRAIN SHALL BE CONNECTED TO THE NEW DRAIN IN AN APPROVED MANNER.
- THE ABOVE, IF REQUIRED, WILL BE PAID AS AN EXTRA TO THE CONTRACT.

567
- SEE DETAIL 1 FOR NEW CB

148 TO 179.6
- ROAD CROSSING TO BE BY OPEN CUT IN ACCORDANCE WITH GENERAL CONDITION E·17.
- ALL NON-GRANULAR MATERIAL EXCAVATED TO BE HAULED AWAY.

151
- CONSTRUCT 600 mm x 600 mm DITCH INLET CB WITH LOW WALL IN ROAD DITCH AND HIGHWALL TOWARD PROPERTY LINE.
- SET LOW WALL AT ELEVATION 35.70. TOP TO HAVE 2 : 1 SLOPE.
- CONNECT UP TO NEW DRAIN WITH 2 METRES OF 300 mm DIAMETER PLASTIC TUBING.

179.6 TO 400
- PIPE TO BE INSTALLED BY BACKHOE.
- TOPSOIL TO BE STRIPPED, SAVED AND REPLACED SEPARATELY.

400 TO 519.6 = 1+475 AH'D
- LOW WET AREA. SEE GENERAL NOTE 4.

475
- CONSTRUCT BLIND INLET. SEE DETAIL 2.

519.6 = 1+475 AH'D
- IF BORING PORTION ALREADY INSTALLED CONTRACTOR TO VERIFY BORE PIPE ELEVATION BEFORE INSTALLING TILE UPSTREAM.

1+593 TO 1+610.2
- DRAIN TO PASS OVER GASLINE.
- CONTRACTOR TO NOTIFY UNION GAS (1 - 800 - 265 - 8528) 48 HOURS PRIOR TO COMMENCING CROSSING.
- CSP (HELICAL WELD) TO BE PLACED ON 300 mm DEPTH OF CRUSHED STONE FOR 1 METRE EITHER SIDE OF PIPELINE.
- CONTRACTOR TO PLACE ANY SEPARATION MEDIUM REQUIRED BY UNION GAS (WOODEN BLOCK, RUBBER PADS, ETC. TO BE SUPPIED BY UNION GAS.)

1+610.2
- USE A CSP COUPLER FOR CONNECTION TO BORE PIPE.

1+610.2 TO 1+630.8
- SEE BORING PORTION. BORING WORK MAY BE AWARDED AS SEPARATE CONTRACT.

1+611
- CONSTRUCT 600mm x 600mm DITCH INLET CB WITH HIGH WALL ON FENCE LINE, LOW WALL TOWARD RAILROAD CULVERT.
- SET LOW WALL AT ELEVATION 36.00.
- PLACE RIPRAP AND FILTER FABRIC UNDERLAY ON 0.5 m^2 OF AREA IN FRONT OF LOW WALL.
- EXCAVATE A CHANNEL OVER TO RAILROAD CULVERT (1 m BOTTOM, 3 : 1 SIDESLOPE). LEVEL SPOIL IN RAILROAD RIGHT-OF-WAY.
- DITCH INLET TOP TO HAVE 1 : 1 SLOPE.
- SEAL DOWNSTREAM END OF EXISTING DRAIN ON SOUTHSIDE OF FENCE LINE.
- CONNECT DI CB TO NEW DRAIN WITH 2 m OF 150 mm DIA. PLASTIC TUBING.

1+630.8
- CONSTRUCT A 600 mm x 600 mm CB ON PROPERTY LINE. SET TOP AT ELEVATION 37.25. CONNECT BORE PIPE TO CB.
- CONNECT 3 EXISTING DRAINS TO NEW CB. MAKE CONNECTIONS IN NORTH WALL OF CB. EXISTING CSP OUTLETS MAY BE USED FOR CONNECTIONS.
- SUPPLY AND PLACE 7 m^3 OF CRUSHED STONE TO MAKE FIRM BEDDING FOR CONNECTIONS AND CB.
- BACKFILL AND GRADE DISTURBED AREA ON NORTHSIDE OF RAILROAD ENSURE UPSTREAM END OF RAILROAD CULVERT IS OPEN.

ii) BRANCH C

1+025.7
- NEW DI CB TO BE CONNECTED TO EXISTING ROAD PIPE (450 mm) WITH LOW WALL TO NORTH AT ELEVATION 35.20.
- DITCH INLET TOP TO HAVE 1 : 1 SLOPE
- BACKFILL EXISTING DITCH IN ROAD ALLOWANCE AND PLACE RIPRAP PROTECTION AND FILTER FABRIC UNDERLAY IN FRONT OF CB (0.5 m^2 OF AREA)
- CONNECT UP EXISTING TILE DRAIN (250 mm) TO WEST WALL. REUSE EXISTING OUTLET PIPE FOR CONNECTION.

B) BORING PORTION

BRANCH B

1+610.2 TO 1+630.8
- SEE STANDARD SPECIFICATION F·4
- WORK SHOULD BE DONE FROM NORTHSIDE OF RAILWAY DUE TO PRESENCE OF BURIED GAS LINE ON SOUTHSIDE. WORK MAY BE DONE FROM SOUTHSIDE WITH PRIOR APPROVAL BY ENGINEER AND AFFECTED LANDOWNER.
- ELEVATION OF GAS LINE TO BE CHECKED BEFORE BORING COMMENCES.
- ONLY 50 mm ± VARIATION FROM DESIGN GRADE PERMITTED AT DOWNSTREAM END OF BORING SO THAT DRAIN DOWNSTREAM CAN PASS OVER BURIED GAS LINE.
- REVERSE GRADE NOT ACCEPTABLE.
- CROSSING TO BE INSTALLED BELOW OR SLIGHTLY TO ONE SIDE OF EXISTING RAILROAD CULVERT. IF PORTIONS OF PIPE ARE INSTALLED BY OPEN CUT BETWEEN RAILBED AND FENCELINE THE PIPE SHALL BE WELDED TO GIVE A CONTINUOUS LENGTH OF RIGID PIPE (MINIMUM BORE LENGTH 13 m).
- LAND ON NORTH SIDE OF RAILROAD IS SYSTEMATICALLY TILE DRAINED. ALL TILE AFFECTED BY THE BORE PIT SHALL BE REPAIRED IN AN APPROVED MANNER.
